## Daedaleopsis confragosa (Bolton) Schroet.

Syn: Agaricus confragosus (Bolton) Murrill Ischnoderma tricolor (Bull.) Zmitr

|  | shape | Dimidiate |
| :---: | :---: | :---: |
|  | size | Up to 12 cm wide |
|  | texture | Corky to leathery |
|  | pileus | Buff to light brown; usually zonate and shallowly sulcate; mattedstrigose to glabrous |
|  | stipe | N/A |
|  | context | Pale buff to brown; corky |
|  | pore surface | Light buff; becoming brown in age |
|  | pores | Variable; circular or radially elongated; up to 1 mm in diameter; daedaleoid |
|  | tube layer(s) | Concolorus and continuous with context; up to 10 mm thick |
|  | hyphal system | Trimitic |
|  | clamp connections | Generative hyphae with clamps |
|  | sterile elements | Branching dendrohyphidia present; 2-3 um in diameter |
|  | basidiospores | Cylindric; slightly curved; hyaline; smooth; 9-11 x 2-2.5 um |
|  | substrate/host | On dead wood of many hardwood genera |
|  | seasonality | Annual |
|  | type of decay | White rot of dead hardwoods and conifers |
|  | range | Common throughout eastern and southern hardwood forests; infrequent in western North America but known from the Northwest and Southwest |
| Notes |  | One of the most variable of the polypores |
| References |  | Overholts, 1953 Gilbertson \& Ryvarden, 1986. Grand \& Vernia, 2002 |
